# Konobi game

Software Development Method Project

Fallacara E., Indri P., Pigozzi F.

### Introduction

The **goal** of our project is to implement the **Konobi game** in Java, giving also the user the opportunity to choose between two interfaces: **console version** or **GUI version** 

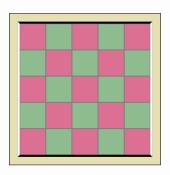

#### Tools

- ▶ IntelliJ;
- ▶ GitHub;
- Gradle: building;
- TravisCI: continuous integrations;
- ▶ JavaFX: ;
- ► Other?

## Konobi

Konobi is a drawless connection game for two players: **Black** and **White**. It's played on the a square board, which is initially empty.

The top and bottom edges of the board are coloured black; the left and right edges are coloured white.

## Konobi Rules

**Starting with Black**, the players take turns placing stones of their own color on empty points of the board, one stone per turn.

### KONOBI RULES

**Starting with Black**, the players take turns placing stones of their own color on empty points of the board, one stone per turn.

Two like-coloured stones are **strongly connected** if they are orthogonally adjacent to each other, and **weakly connected** if they are diagonally adjacent to each other without sharing any strongly connected neighbour.

### KONOBI RULES

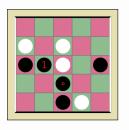

**Starting with Black**, the players take turns placing stones of their own color on empty points of the board, one stone per turn.

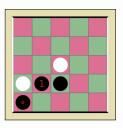

Two like-coloured stones are **strongly connected** if they are orthogonally adjacent to each other, and **weakly connected** if they are diagonally adjacent to each other without sharing any strongly connected neighbour.

It's **illegal** to make a weak connection to a certain stone unless it's impossible to make a placement which is both strongly connected to that stone and not weakly connected to another.

## LEGAL AND ILLEGAL MOVES

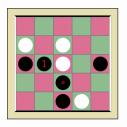

### Legal moves:

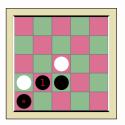

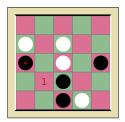

## LEGAL AND ILLEGAL MOVES

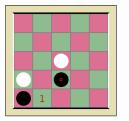

#### Legal moves:

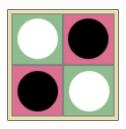

### Illegal moves:

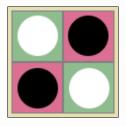

It's also **illegal** to form a **crosscut**, i.e., a 2x2 pattern of stones consisting of two weakly connected Black stones and two weakly connected White stones.

It's also **illegal** to form a **crosscut**, i.e., a 2x2 pattern of stones consisting of two weakly connected Black stones and two weakly connected White stones.

If a player can't make a move on his turn, he must **pass**. Passing is otherwise not allowed. There will always be a move available to at least one of the players.

The **pie rule** is used in order to make the game fair. This means that White will have the option, on his first turn only, to change sides instead of making a regular move.

The **pie rule** is used in order to make the game fair. This means that White will have the option, on his first turn only, to change sides instead of making a regular move.

The game is **won** by the player who completes a chain of his color touching the two opposite board edges of his color. **Draws are not possible**.

# STARTING GAME

The console version of the game can be started using:

> ./gradlew runConsole

The GUI version of the game can be started using:

> ./gradlew runGUI

## CONSOLE USER INTERFACE

- ConsoleBoardWriter: board display;
- ConsoleCellRepresentation: conversion between cell color and its representation;
- ConsoleInputHandler: player input handling;
- ConsoleMessageWriter: messages to the players.

Messages are contained in the Messages class: its messages are used by the GUI implementation as well.

## Graphical User Interface

- ► GUI: implements the game flow in a JavaFX application;
- GUIBoardWriter: board and GUI display;
- GUIAsker: boh;
- GUIMessageWriter: messages to the players.

The Events package defines events for the rules (PieRule, PassRule and EndGameRule); the events are processed by the Handlers package, which handles mouse inputs as well.
